/polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-AG1
library is a normalized library constructed from 13 dpc
rat ventricle. The tag is a string of 6 nucleotides
present between the Not I site and the oligo-dT track.
The library was constructed as described by Bonaldo,
Lennon and Soares, Genome Research 6: 791-806, 1996.
Lennon and Soares, Genome Research 6: 791-806, 1996.

REMARK COMMENT

in signalling and nuclear proteins. In EPH-related tyrosine kinases, appears to mediate cell-cell initiated signal transduction via the binding of SH2-containing proteins to a conserved tyrosine that is phosphorylated. In many cases mediates homodimerisation"

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence is that of a polynucleotide encoding a fragment of novel low density lipoprotein binding proteins (LBPs) of the invention (see AAB82797-820). LBPs are capable of binding to native and methylated low density lipoproteins (LDLs). Isolated polynucleotides encoding novel LBPs and their fragments are claimed, as well as expression vectors, cells and methods of producing the LBPs. Methods of determining if an animal is at risk for atherosclerosis, methods for evaluating an agent for use in treating atherosclerosis, and methods for treating a cell having an abnormality in structure or metabolism of LBP are also claimed, as are pharmaceutical compositions comprising an LBP polypeptide or nucleic acid, and vaccine compositions

Human secreted proteins and gene sequences encoding them, useful for detecting, preventing, and treating disorders such as cancer, neurological disorders and immune system disorders.

Claim 1; Page 344; 429pp; English

invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Example of activities include: neuroprotective; cytostatic; cardioactive; immunomodulatory; muscular active general; vulnerary; gastrointestinal; nephrotropic; antiinfective; gynaecological; and antibacterial. The polynucleotides can be used for the detection of various disorders such as cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The secreted proteins can be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wound healing, and infectious diseases. The proteins can also be used as a food additive or preservative to increase or decrease storage capabilities. AAC59557 to AAC59565 and AAB34298 represent sequences used in the exemplification of the present invention The polynucleotide sequences given in AAC59566 to AAC59614 encode the human secreted proteins given in AAB3429 to AAB34347. AAB34348 to AAB343437 represent human secreted polypeptide sequences and proteins homologous to them, which are given in the exemplification of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This cDNA clone codes for novel human low density lipoprotein (LDL) binding protein LBP-2 (see AAW49041). It was isolated by screening human liver, aorta and foetal brain cDNA libraries with rabbit LBP-2 cDNA. cDNA clones (see AAW32834-39) and encoded rabbit and human LBPs (see AAW49037-42) are claimed. An abnormality in LBP metabolism or structure is diagnostic of a risk for atherosclerosis. The invention provides: methods for determining if an animal is at risk for atherosclerosis (e.g. for prenatal screening); methods for treating atherosclerosis (including gene therapy) using e.g. LBP polypeptides to bind LDL and thereby prevent formation of atherosclerosic plaque; and methods for treating a cell having an abnormality in LBP structure or metabolism. Pharmaceutical and vaccine compositions are also provided, as well as recombinant vectors and host cells used to produce recombinant LBP
                                                                                                                                                                                                                            Human low density lipoprotein binding protein 2 (LBP-2) cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 1208 BP; 252 A; 368
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid encoding low density lipoprotein binding proteins and related vectors - transformed cells, proteins, and modulators of binding, useful for treatment and diagnosis of atherosclerosis and for identifying

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is that of a partial cDNA encoding novel human low density lipoprotein binding protein 2 (LBP-2, see AAB82803). Clones were isolated from human foetal brain, liver and aorta cDNA libraries using rabbit LBP-2 cDNA as probe. A full-length cDNA clone is given in AH26499, and a genomic DNA sequence is given in AH26495. LBP-2 nucleic acids are among claimed polynucleotides of the invention that encode novel polypeptides capable of binding to native and methylated LDL. Also claimed are isolated LBP polypeptides, and biologically active fragments and analogues of them, as well as expression vectors, cells and methods of producing the LBPs. Methods of determining if an animal is at risk for atherosclerosis, methods for evaluating an agent for use in treating atherosclerosis, methods for treating a cell having an abnormality in structure or metabolism of LBP are claimed. Pharmaceutical compositions comprising an LBP polypeptide or nucleic acid, and vaccine compositions,

neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic and cardiant activity. The polynucleotide and protein sequences are used in the diagnosis of cancer, particularly breast and ovarian cancer. The nucleic acid sequences, proteins, agonists and agonists may also be used in the diagnosis, prevention and treatment of immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; cardiovascular disorders such as myocardial ischaemias, wound healing; neurological diseases such as cerebral anoxia and epilepsy; and infectious diseases
                                                                                                                                                                                                                                                                                                                     associated with breast and ovarian cancer. Included in the invention are sequences AAF22032 - AAF22040 and AAB59129 which are used in the isolation and characterisation of the DNA and protein sequences of the invention. The breast and ovarian cancer associated DNA, protein, agonist or antagonist sequences exhibit cytostatic; immunosuppressive; nootropic;
                                                                                                                                                                                                                                                                                                                                                                                                                    Sequences AAF21614 - AAF22031 represent DNA sequences encoding human proteins AAB58711 - AAB59128. The DNA and protein sequences are associated with breast and ovarian cancer. Included in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New human breast and ovarian cancer associated gene sequences and the polypeptides encoded by these genes, useful in the prevention, treatment and diagnosis of cancer, immune disorders, cardiovascular disorders and neurological diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 1; Page 670-671; 1299pp; English.

New isolated low density lipoprotein binding polypeptide for treating, diagnosing and/or identifying therapeutic agents for atherosclerosis.

Claim 7; Fig 7A; 143pp; English.

The present sequence is that of the coding region of the human gene (See Cl also AAH26494) encoding novel human low density lipoprotein binding CC protein 2 (LEP-2, see AAB2806). The gene was isolated from a genomic DNA cl library using LEP-2 cDNA as probe. The LEP-2 protein predicted from the compresent sequence differs from that predicted from a cDNA clone (see CC Present sequence differs from that predicted from a cDNA clone (see CC Laimed polymucleotides of truncation). LEP-2 nucleic acids at its N-cc terminus (the cDNA is a 5' truncation). LEP-2 nucleic acids are among CC claimed polymucleotides of the invention that encode novel polypeptides (CC apable of binding to native and methylated LDL. Also claimed are isolated LEP polypeptides, and biologically active fragments and compositions of them, as well as expression vectors, cells and methods for producing the LEPs. Methods of determining if an animal is at risk for atherosclerosis, methods for treating an agent for use in treating catherosclerosis, and methods for treating a cell having an abnormality in structure or metabolism of LEP are claimed. Pharmaceutical compositions, care also claimed

                                                                                                                                      Alignment Scores:
                                                                                                                                                                                The present sequence is that of genomic DNA encoding novel human low density lipoprotein binding protein 2 (LBP-2, see AAB82806). The DNA was isolated from a human genomic library by screening with LBP-2 cDNA (see AAH26494). The open reading frame spans 5 exons. Human LBP-2 nucleic acids are among claimed polynucleotides of the invention that encode novel polypeptides, termed LBPs, capable of binding to native and biologically active fragments and analogues of them, as well as expression vectors, cells and methods of producing the LBPs. Methods of determining if an animal is at risk for atherosclerosis, methods for revaluating an agent for use in treating atherosclerosis, and methods for revaluating a cell having an abnormality in structure or metabolism of LBP are claimed. Pharmaceutical compositions comprising an LBP polypeptide or nucleic acid, and vaccine compositions, are also claimed

                                                                                                                                                        The present sequence is that of cDNA encoding a portion (see AAB82799) of novel rabbit low density lipoprotein binding protein 2 (LBP-2). The cDNA was isolated following screening of a rabbit cDNA library for clones encoding LBPs that bound to both native low density lipoprotein (LDL) and methyl LDL. A full-length sequence for LBP-2 is given in AAR26500. The invention provides claimed polymolectides encoding novel polypeptides which are capable of binding to native and methylated LDL, the isolated polypoptides, termed LBPs, and biologically active fragments and analogues of them, as well as expression vectors, cells and methods of producing the LBPs. Also claimed are methods of determining if an animal is at risk for atherosclerosis, methods for evaluating an agent for use in treating atherosclerosis, and methods for revaluating an agent for use compositions comprising an LBP polypeptide or nucleic acid, and vaccine compositions. are also claimed
                                                                                                                     Sequence 1362 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated low density lipoprotein binding polypeptide for treating, diagnosing and/or identifying therapeutic agents for atherosclerosis.

diagnosing New isolated low

Example

CC The present sequence is that of cDNA encoding a portion (see AAB82800) of movel rabbit low density lipoprotein binding protein 3 (LBP-3). The cDNA cc was isolated following screening of a rabbit cDNA library for clones cenciding LBPs that bound to both native low density lipoprotein (LDL) and cc methyl LDL. A full-length sequence for rabbit LBP-3 cDNA is given in cc AAH26491. The invention provides claimed polymuclectides encoding novel cc polypeptides which are capable of binding to native and methylated LDL, ct he isolated polypeptides, termed LBPs, and biologically active fragments cand analogues of them, as well as expression vectors, cells and methods of producing the LBPs. Also claimed are methods of determining if an cc animal is at risk for atherosclerosis, methods for evaluating an agent cf or use in treating atherosclerosis, methods for treating a cell compositions comprising an LBP polypeptide or nucleic acid, and vaccine cc compositions, are also claimed

subjects at risk. Nucleic acid encoding low density lipoprotein binding proteins and related vectors - transformed cells, proteins, and modulators of binding, useful for treatment and diagnosis of atherosclerosis and for identifying

Claim 4; Fig 11; 47pp; English

This cDNA clone codes for novel rabbit low density lipoprotein (LDL) binding protein LBP-2 (see AAW49038). It was isolated by functional screening of a cDNA library, produced from balloon-deendothelialised healing rabbit abdominal aorta mRNA, for clones encoding LBPs able to bind both native and methyl LDL. cDNA clones (see AAV32834-39) and encoded rabbit and human LBPs (see AAW49037-42) are claimed. An abnormality in an aspect of LBP metabolism or structure is diagnostic a risk for atherosclerosis. The invention provides: methods for determining if an animal is at risk for atherosclerosis (e.g. for greenatal screening); methods for treating atherosclerosis (including g (including gene of.

The present sequence is that of cDNA encoding a portion (see AAB82798) c novel rabbit low density lipoprotein binding protein 2 (LBP-2). The cDNA was isolated following screening of a rabbit cDNA library for clones encoding LBPs that bound to both native low density lipoprotein (LDL) armethyl LDL. A full-length sequence for LBP-2 is given in AAH26500. The invention provides claimed polynucleotides encoding novel polypeptides which are capable of binding to native and methylated LDL, the isolated
                                                                                                                                                                    New isolated low density lipoprotein binding polypeptide for treating, diagnosing and/or identifying therapeutic agents for atherosclerosis.

Also claimed are methods of determining if an animal is at risk for atherosclerosis, methods for evaluating an agent for use in treating atherosclerosis, and methods for treating a cell having an abnormality in structure or metabolism of LBP. Pharmaceutical compositions comprising an LBP polypeptide or nucleic acid, and vaccine compositions, are also claimed
                                                                                                   New isolated low density lipoprotein binding polypeptide for treating, diagnosing and/or identifying therapeutic agents for atherosclerosis.
                                                                                                                                                                      Lees

```

The present sequence is that of cDNA encoding novel rabbit low density lipoprotein binding protein 1 (LBP-2, see AAB82807). The cDNA was isolated following screening of a rabbit cDNA library for clones encoding that bound to both native low density lipoprotein (LDL) and methyl LDL. The invention provides claimed polynucleotides encoding novel polypeptides which are capable of binding to native and methylated LDL, the isolated polypeptides, termed LBPs, and biologically active fragmer

methylated LDL, y active fragmen

encoding methyl

The invention relates to Arabidopsis thaliana nucleic acid sequences. The CC DNA sequences and the polypeptides they encode are useful for identifying chomologous or related genes, for producing compositions that modulate the expression or function of the polypeptides, for mapping functional regions of the protein, in diagnosis, for studying associated regions of the protein, in diagnosis, for studying associated plant cells, in screening assays of various plant strains to determine the strains that are capable of withstanding a particular disease or environmental stress, for enhancing or inhibiting production of converted transgenic organisms, such as plant colls and plants. Transgenic plants colls in plants and to create genetically modified and transgenic organisms, such as plant cells and plants. Transgenic plants collegance in plants, screening biologically active agents, such as collegance and stress converted to the print of the sequence data for this patent converted and transport of the print of specification but was obtained in the converted production of the print of the sequence data for this patent converted to the print of the sequence of the sequence of the sequence of the print of the print of the print of the sequence of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel Arabidopsis thaliana nucleic acid useful for ic
or related genes, and to create genetically modified
organisms, such as plant cells and plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; SEQ ID NO 708; 45pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     identifying homo

```

The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising: (a) contacting nucleic acid representative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office Sequence 2838 BP; 784 A; 600 C; 703 G; 751 .. '-0 U; 0 Other;

r response to a plant ting plant to

> S Percent Similarity: Best Local Similari 88888888**%**& 용 US-09-976-740-22 Query Match: Alignment Scores: comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (MI) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to Sequence 2838 BP; illustrate the invention.
